Bet #3 preread

Two pages before Monday. The first ask at the bottom is the one that needs five minutes in advance, because it means looking at the attached flyer. The rest can wait for the room.

Where Bet #2 landed

19 responses so far, 18 of them aged 18 to 30.

Benefit	Picked
Dental	60%
Therapy and mental health	53%
The other four	clustered close behind

Two caveats we would rather state than have you find.

The sample is small. The gap between dental and therapy sits inside the margin of error. We are treating this as a direction, not a result.

The rates always average 50% by design. Each screen puts three benefits against the other three, so a benefit below 50% appeared less often in the packages people chose. It is behind the field, not unwanted.

Against our own success criteria, which were one benefit clearly outperforming the others and four out of five people favouring the same one, we have a leader and we do not yet have the agreement.

Why Bet #3 is not simply more survey responses

More responses would sharpen the ranking. They would not tell us what dental means to somebody: a cleaning, help with a filling, or a crown they have been putting off. Those are three different things to build, and a ranked category is not something anyone can cost.

Your feedback on the fitness benefit is what made this concrete for us. Our wording read as a gym membership when we meant anything that keeps someone moving. If it read that way to you, it read that way to our respondents, and that is not a problem we can fix by asking people more questions about wording.

What we built, and what we are testing

A flyer, attached, and a page it links to at `kp-fung-saffreon.vercel.app/plan`.

The page offers four ways in: what is included, who could get it, how it would work, and is this real. Which one somebody opens first tells us what they needed to know before going further.

The bet. Shown the flyer with a clear next step, at least four of five people aged 18 to 30 click through within a minute, unprompted. We count the click, not whether they say they like it.

Two tracks, reported separately. Five people we recruit and watch, which is what the four-of-five judges, and public posts on Instagram, Discord, Snapchat and Facebook, which give reach and a click rate per platform but cannot confirm who clicked. A normal social click-through rate is one to three percent, so holding a public post to four of five would make a good flyer look like a failure.

On privacy: no IP addresses, no cookies, nothing that follows anyone. The page states plainly that the benefit does not exist and nobody is selling it, and none of the materials carry KP branding.

Three things we need from you

1. What can this not claim? This is the one worth five minutes before Monday. The flyer goes out this week, and we have written specifics about covered services, referrals and access that we are not qualified to promise. We would rather hear it now than after five hundred people have read it.

2. Fifteen minutes with whoever knows benefit design. Starting with dental. What a realistic amount looks like, what the limits are, what somebody actually receives. That single conversation is the difference between a ranked category and something that could be built. A name on Monday is enough and we will arrange the rest.

3. How does this sit next to KP Rewards? We have seen flexible dollars and Gen Z in your own material. If that is the same mechanism we would rather build on it than present something beside it at the final.

Next time we meet we will bring numbers: the five person test, the public response, and which part of the offer people opened first.
